

1964-1966 Mustang Autoworks Power Door Lock Kit Troubleshooting Questions

If you are experiencing difficulties with your 64-66 Mustang Power Door Locks, please refer to the questionnaire below prior to contacting us. We'll need this information to better assist you.

64-66 Mustangs use non-adjustable door lock rods, unlike their 67-70 Mustang counter parts. Because of this, installation of the door latch in 64-66 Mustangs can be less forgiving than later years. Your new Power Door Lock kit is still tension based, just as your original latches were. Certain amounts of tension are needed to make your door lock/latch function. Too much or not enough tension can cause your door latches to improperly function. Typically, this is the #1 cause for your technical difficulty.

To fully understand what's occurring in your situation we'll need you to answer the following questions:

1. Does your door open from the inner door handle, regardless of whether it's in the locked or unlocked position?
2. Can you lock or unlock the door from the outside?
3. Does the outer door handle push-button operate correctly in the unlocked position?
4. Does your door handle operate properly from the outside when locked?
5. Does your door lock operate properly when using a switch or keyless entry?
